BY TSF AI

Alien Invasion

Hah...
Just 1 more
lap around
the park

Okay...
Just a little
more and
I've finished
my runs

I...
Can't wait to get home and have a nice shower

And...
That should
do it for
today...

Arghh... What is happening? My body feels odd

Nngh...
What was
that?

Huh?
It felt like something bright and piercing just hit my body

Aghh...
It feels like my body is burning from the inside

I can't...
Feel my arms
any more...
What is
happening
to me?

My face feels weird now... I can't see out of my right eye

My voice...
It... It's...
....
....

Subject transformation: complete!
External structure intact
Cellular density reduced to a pliable organic shell...
Satisfactory!

The “Mimetic Conversion Beam” leaves no traceable biological waste... The target’s consciousness successfully erased.

Primitive minds would label this as “death.” Incorrect... It is optimization removal of excess biological complexity to create a vessel for infiltration

Auditory sensors detect approaching machinery Potential witness proximity increasing

Exposure risk unacceptable Immediate assimilation required... Application of disguise commencing... Infiltration through imitation

Initial integration proceeding

Resistance minimal... Internal adhesion responding to thermal contact... Material conforms to movement adaptive flexibility confirmed

Outer layer alignment incomplete... Facial segment pending synchronization

Human expressions rely on complex muscular arrangements Precision essential for deception

Adjusting ocular orientation... auditory mapping... mandibular calibration...

Surface contact achieved... Finalizing adhesion

Surface temperature: optimal... Texture replication indistinguishable from organic origin... Pore structure microscopic yet consistent

Expression database loaded successfully... Emotional context unnecessary

Muscle imitation within 0.02 percent deviation... Ocular tracking stable... No external irregularities detected

Hu...
Man...
Speech...
Pattern...
Stabilizing

Human
speech
pattern
stabilizing...
Acceptable

Establishing link to ocular systems

Neural relay synchronization at ninety-eight percent... Ninety-nine... Complete

Light intake optimal... Color differentiation confirmed... Depth perception operational

Mass distribution altered... Center of gravity shifted downward... Limb proportions differ from other human female subjects

Curvature is very pronounced Functional purpose: unclear beyond reproductive signaling and aesthetic perception by peers

Two large soft masses present... Structure: fatty tissue covering pectoral region... Weight and movement will affect balance and posture... Sensory feedback: new and requires adjustment

Additional forward mass increases oscillation during motion... Compensatory counterbalance required in shoulders and spine... Human posture appears evolved to accommodate this distribution

Tissue softness and volume unusual for prior units... Resistance to movement noted... Data classified as human-specific anatomy

Lateral sway detected... Appears to aid balance rather than hinder it... Possibly also something that helps attract a mating partner much like the area around the chest

Further investigation required... Many structures appear designed for functions beyond pure utility... Perhaps for sensory signaling... Communication or social response

Conclusion: additional field research essential... Human female morphology serves purposes extending past survival mechanics... Data collection will continue

Commencing neural sync sequence... Establishing cognitive bridge between host and infiltrator consciousness

Error detected... Data access incomplete... Memory retention level: 10%

Emotional resonance seems required to unlock deeper levels of memory... This species cognition is protected by... Feelings

It seems in order to achieve full synchronization I must induce or replicate a strong sensory or emotional reaction... The host's mind may unlock itself only under stimulus

Host designation identified: Sofie Madsen... Occupation: administrative assistant... Current residence: 214 Brookhaven Avenue Apartment 3B Springfield... Civil connections include two parental units and one sibling

Current objectives: secure environment... Continue observation and attempt further memory synchronization

Decision: return to host residence 214 Brookhaven Avenue Apartment 3B... Controlled environment may allow safer experimentation with sensory stimuli and behavioral mimicry

Location confirmed...
Host entry point: Apartment 3B...
Structural integrity intact...
Environmental conditions stable

Door mechanism requires rotational force followed by inward pressure...
No immediate threats detected...
Entry feasible

Entry successful... Environmental parameters match host data... Observation phase begins

Spatial arrangement consistent with prior memory fragments... Functional zones detected: living area... Work station... Storage and rest area

What was that unexpected tactile input just now?

Who is there... Show yourself this instant

Relax babe... It's just me... Your loving boyfriend

Unknown terminology associated with host: “babe,” “boyfriend.” Contextual inference: relationship likely intimate... Behavioral cues indicate positive reinforcement and physical familiarity

You feel okay babe? You're ussually more energetic

Hypothesis a simplified behavioral output may improve interaction efficiency and reduce social anomalies

Sorry babe... I just feel the need to stimulate my body

I see...
Then lets have some fun before you jump in the shower to wash off that sweat from your run

It would seem that this human male has understood my intentions clearly

Synchronization level is now at twenty-five percent... Neural bridge is expanding

I want you to pleasure this body

Woah! Someone is eager to get started

Synchronization efficiency correlates with emotional proximity... Continued intimate contact with this individual may accelerate cognitive access

Since you're so eager and ready... I won't hold back

What did he just do to this body? It feels like he insert some kind of large object into my body... But these sensations are incredible

Ahhhh!

It feels like my cognitive functions are slowing down and I feel some primal urges are growing stronger
Ugghhhh!

Mind...
Can't... Focus...
Too many
stimulations...
Incredible
Pleasure

I'm
cumming
babe!

Cum
inside
this body

Finally this body's mind is fully accessable to me now
Synchronization status: Current level is 100%

I should contact my fellow "aliens" as humans apparently call us to invade this planet and experience this incredible amount of pleasure

Time to wash my body after that incredible sex I just had with my amazing boyfriend Ryan
