Aiko Okazaki

Height: 157 cm (5'2")

Sex: Female

Age: 26

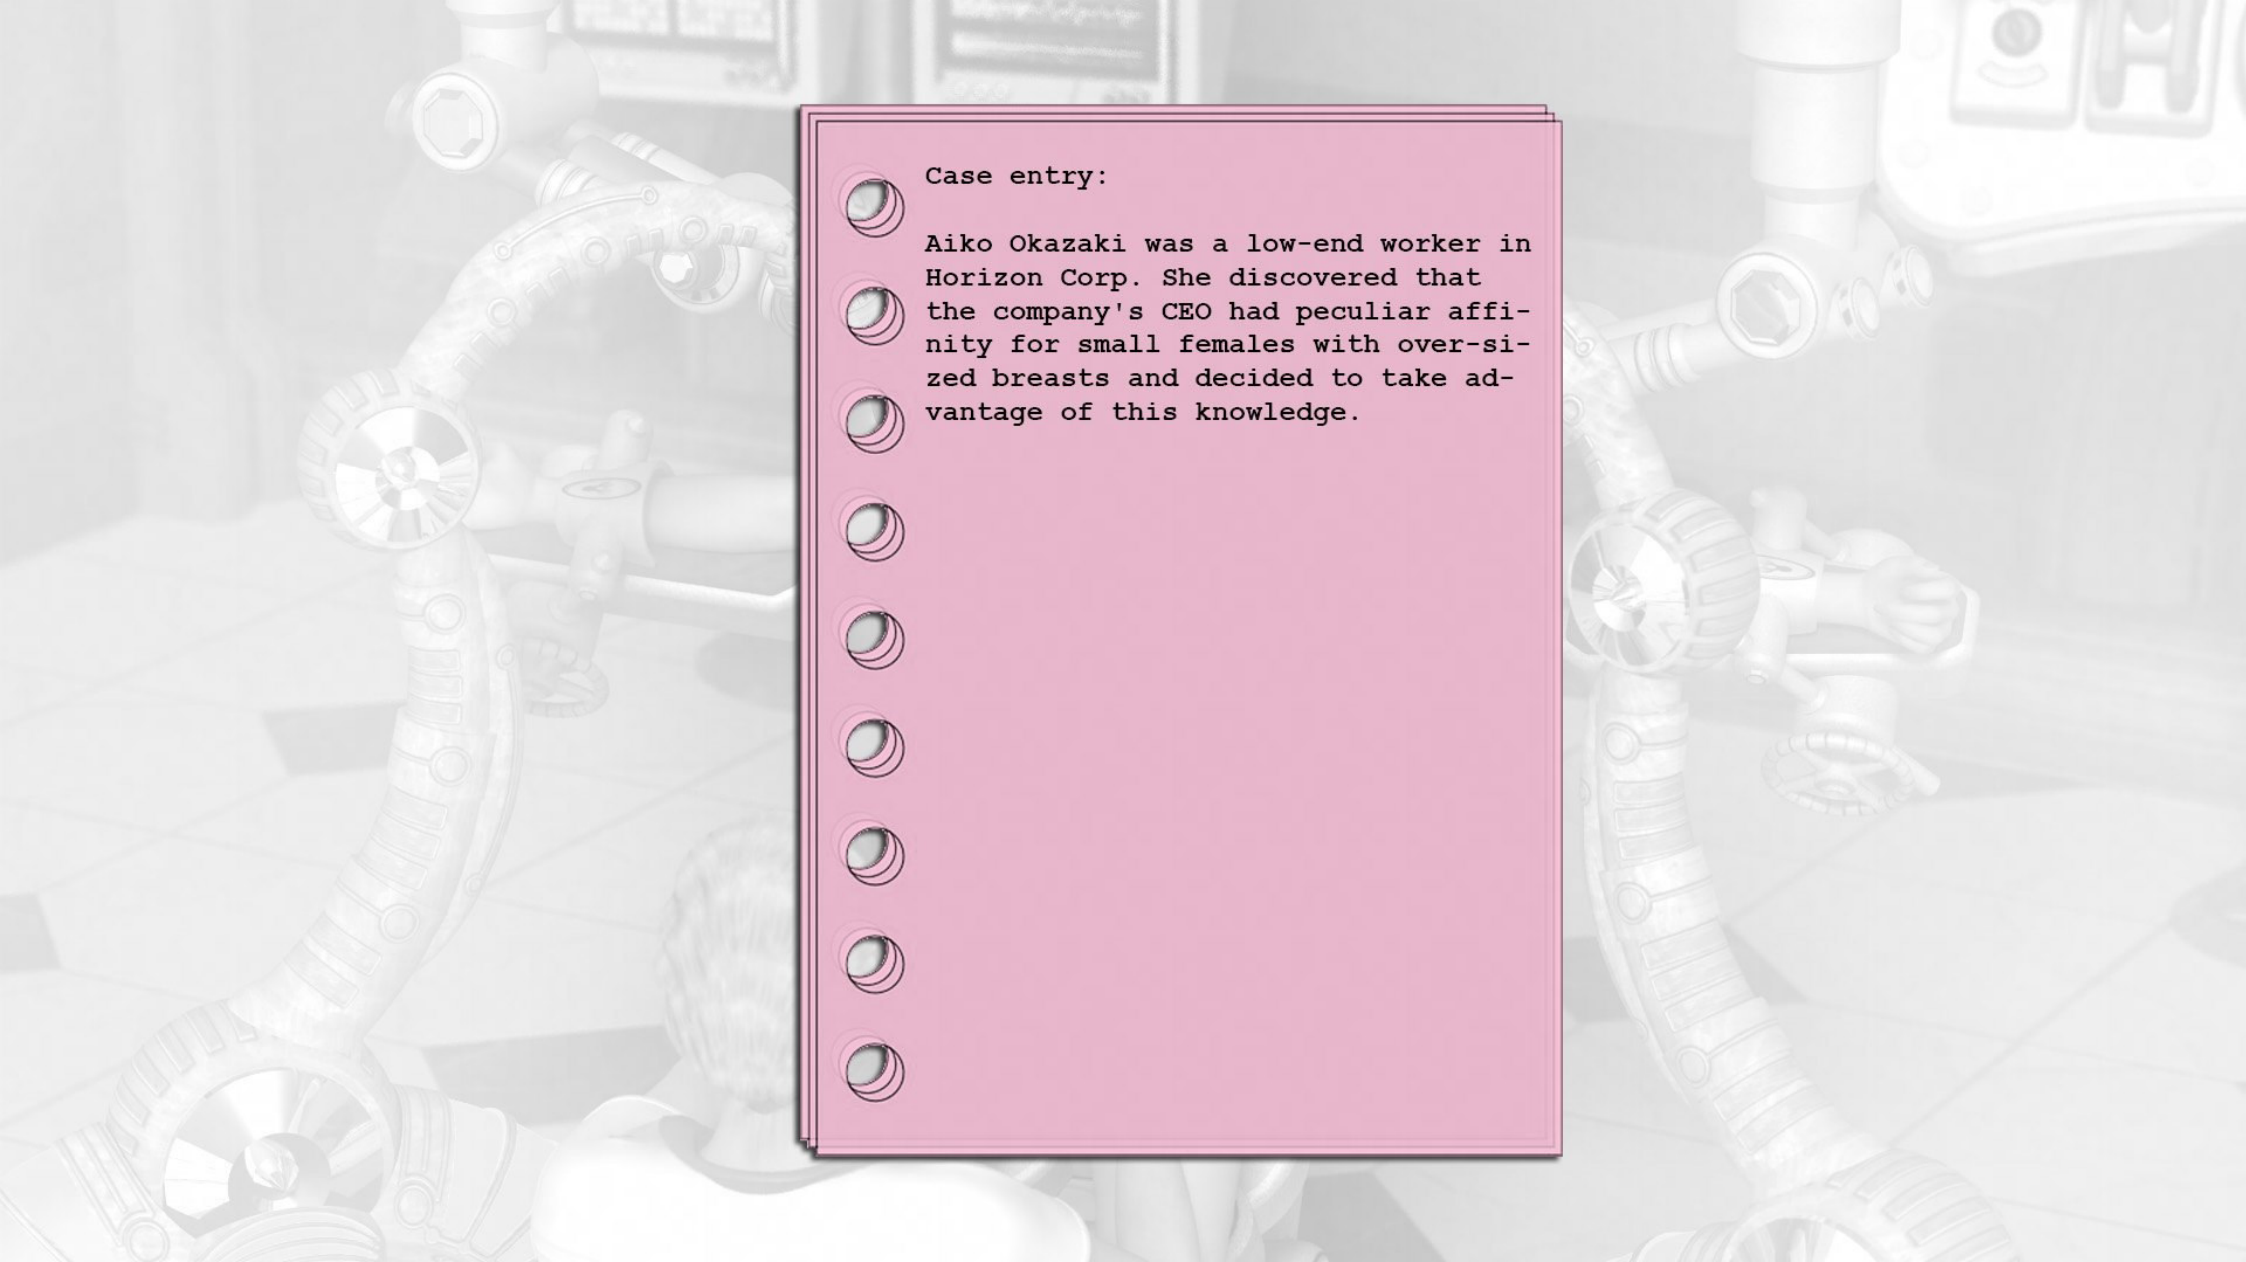

Race: Asian / Caucasian

Description:

Subject has an exceptionally petite body compared with other females of her age.

Primary psychological analysis showed that the subject is an anti-social entity with affected empathic perception. Okazaki has strong propensity to manipulate people around for her own benefits. Subject Okazaki also shows signs of obsession with large breasts.

Case entry:

Aiko Okazaki was a low-end worker in Horizon Corp. She discovered that the company's CEO had peculiar affinity for small females with over-sized breasts and decided to take advantage of this knowledge.

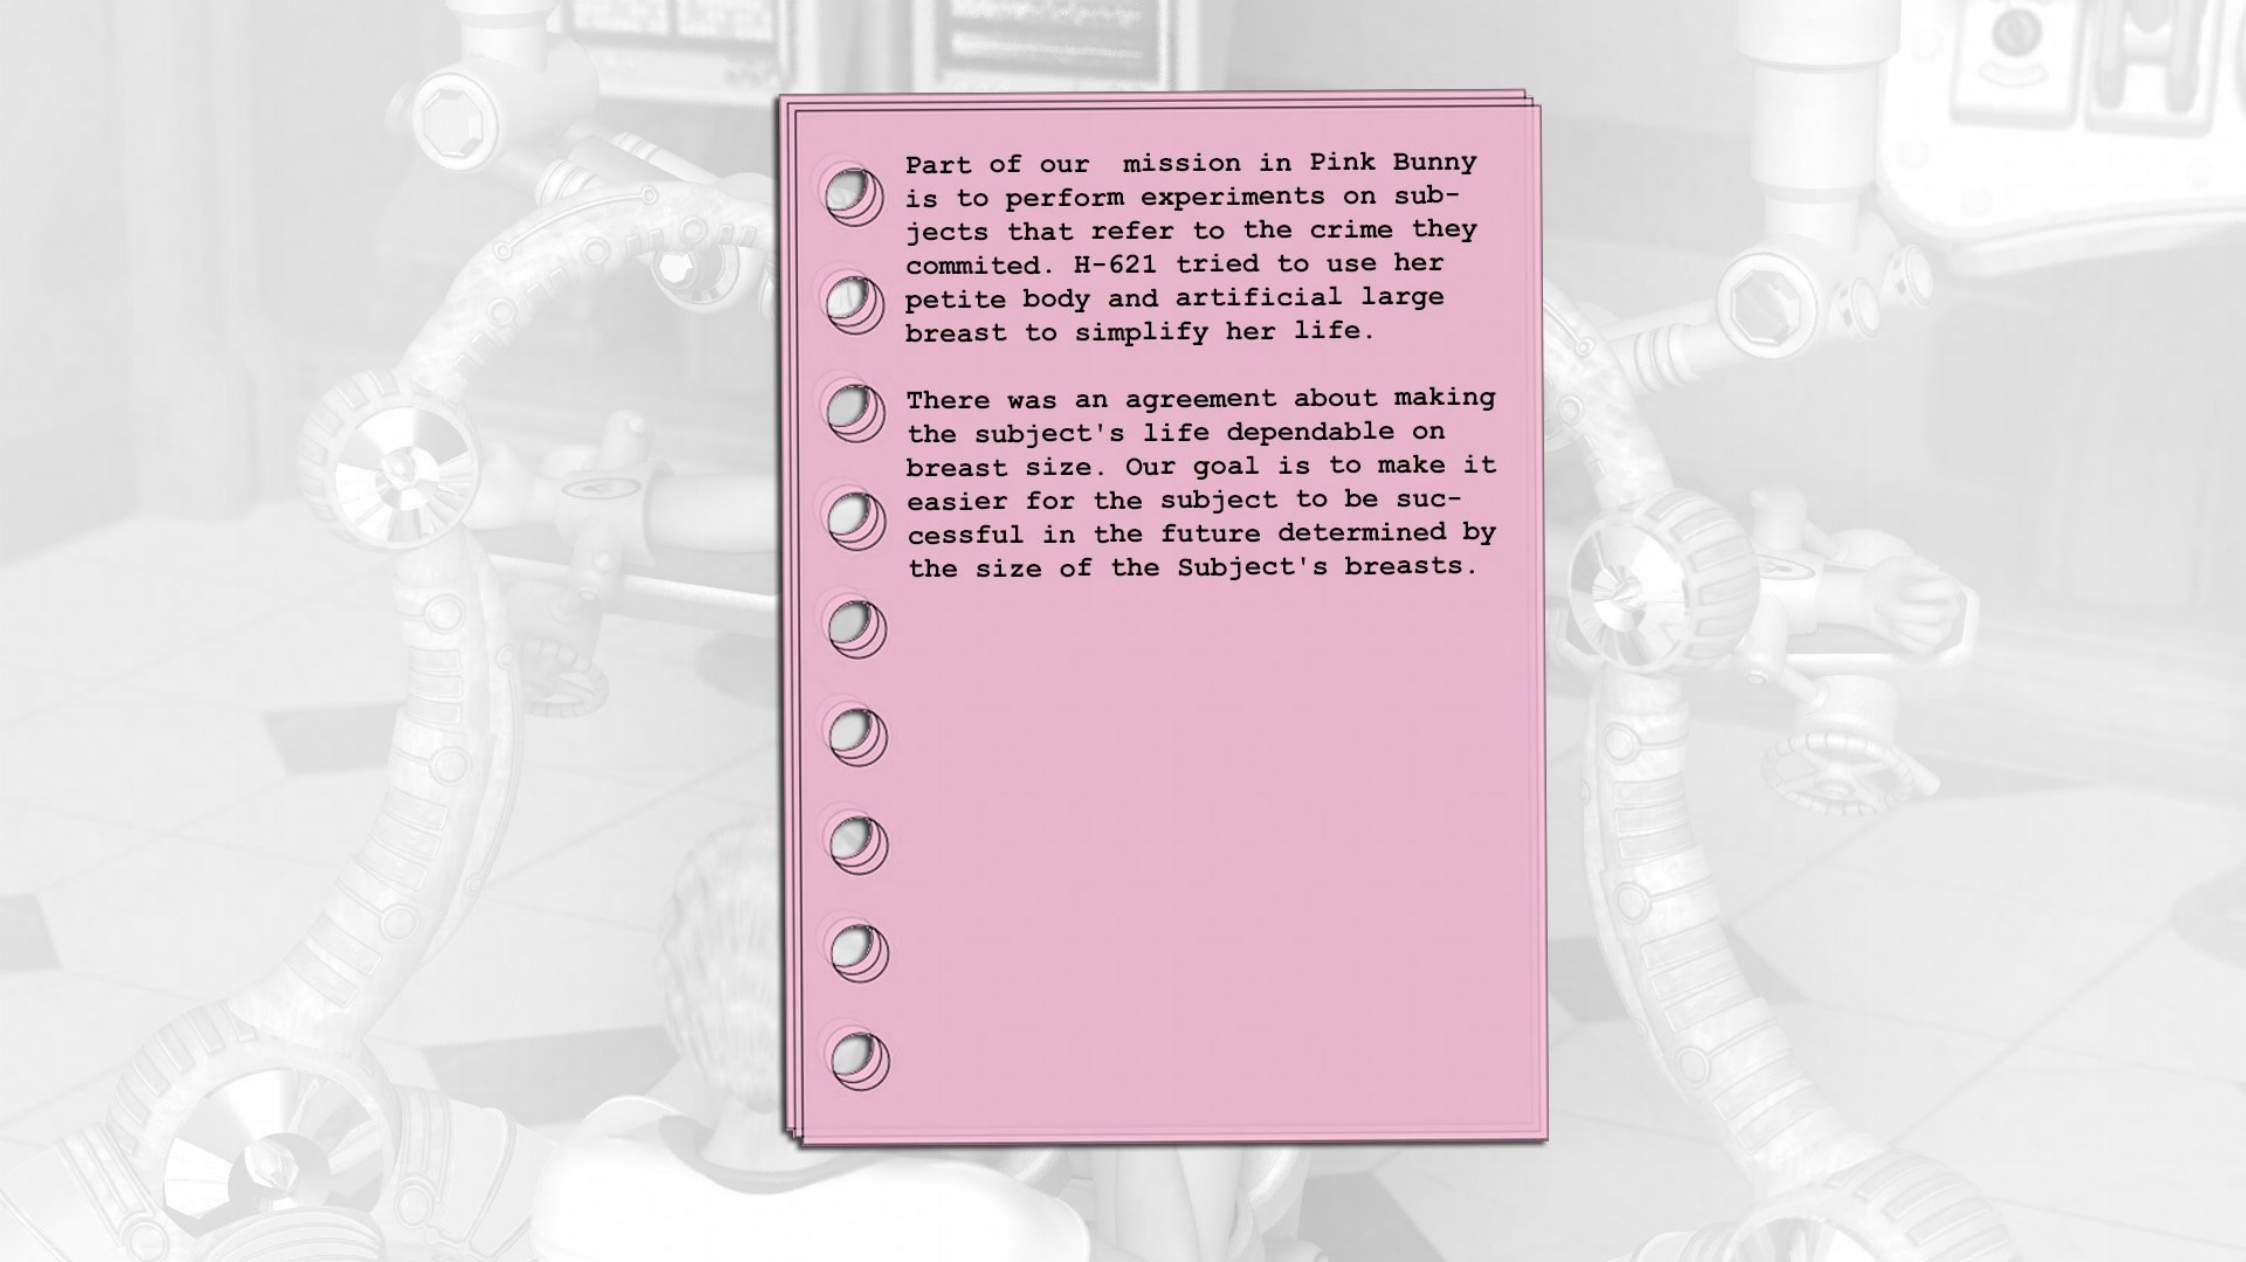

Subject enlarged her breasts by using implants which are considered to be huge by market standards. Afterwards, she got closer to the CEO and started emotional affair with her target. It allowed her to influence important decisions and thus she received a promotion for a senior position and access to corporate resources.

Following the promotion she neglected her duties, using Horizon financial resources and assets without any restriction. Subject's activities were discovered and an internal investigation took place.

Aiko Okazaki was deprived of all stolen resources and surcharged with additional fee of 250.000 new Yen (Corporate Law, [16], § 354, {17.04.2037}). Due to her insolvency Aiko was handed over for Horizon Corp auction where she was acquired by our company, Pink Bunny. After settling Miss Aiko's financial commitments, Pink Bunny acquired rights to use her for the period of 1 year (standard procedure). From now on she shall be referred to as Subject H-621.

Part of our mission in Pink Bunny is to perform experiments on subjects that refer to the crime they committed. H-621 tried to use her petite body and artificial large breast to simplify her life.

There was an agreement about making the subject's life dependable on breast size. Our goal is to make it easier for the subject to be successful in the future determined by the size of the Subject's breasts.

○ Changes designed for H-621 are too extreme to apply all at once. Surgical shock might be too strong for the mind and body.

○ Standard market implants were replaced with prototype units which will slowly increase their size within a period of time. Shape disturbances may occur due to the revolutionary nature of the process as well unusual volume choices as our target. To prevent such outcome prototype units with intelligent tissue have been produced.

○ Currently H-621 breasts are small comparing to the final result but faster enlargement might be too much of a shock for the subject. Their enhancement should proceed with caution.

○ Moreover, her skin must become accustomed to larger sizes as it is overstretched. However, latest regenerating substances improve stretchiness and shorten the healing process.

○ There is no need for additional back strengthening exercises. Mobility is not a highly desired feature in this case. We will limit our actions to medication improving body efficiency.

We recorded a rapid increase of nipple and areola tissue. Touching those areas results in strong responses from lamina terminalis. It seems that the Subject's brain is not capable of interpreting this, previously unknown, kind of impulses correctly. It is probably due to the Subject's unusual way of interpreting pleasure from stimulation.

As predicted during entry research small pits of 1cm in diameter developed in enlarged nipples. This created an opportunity to stimulate newly created areas in a more effective way.

Prof Tanaka's note: Make sure they understand that lamina terminalis means pleasure zone.

○ H-621 Breasts reached the size that exceeded most of pre-established targets, however we agreed to continue the process of enhancement.

○ Petite body of the subject is not able to support the actual weight of her new breast since they immobilize her. We would like to use this fact as a non-standard movement restriction system.

○ Nipples grew larger than expected. Moreover, pits became deeper. For this reason we decided to make changes in our research program. We will try to increase number and frequency of provided stimulation.

○ H-621 does not want to accept her breast size and exceptional pleasure which she experiences through stimulation of modified body parts. Due to her attitude we agreed to enforce compulsory masturbation through breast and nipple penetration. We hope that long exposition to these stimuli will change the way she sees her body.

H-621 is not willing to cooperate,
so we have to use persuasion and
force if needed.

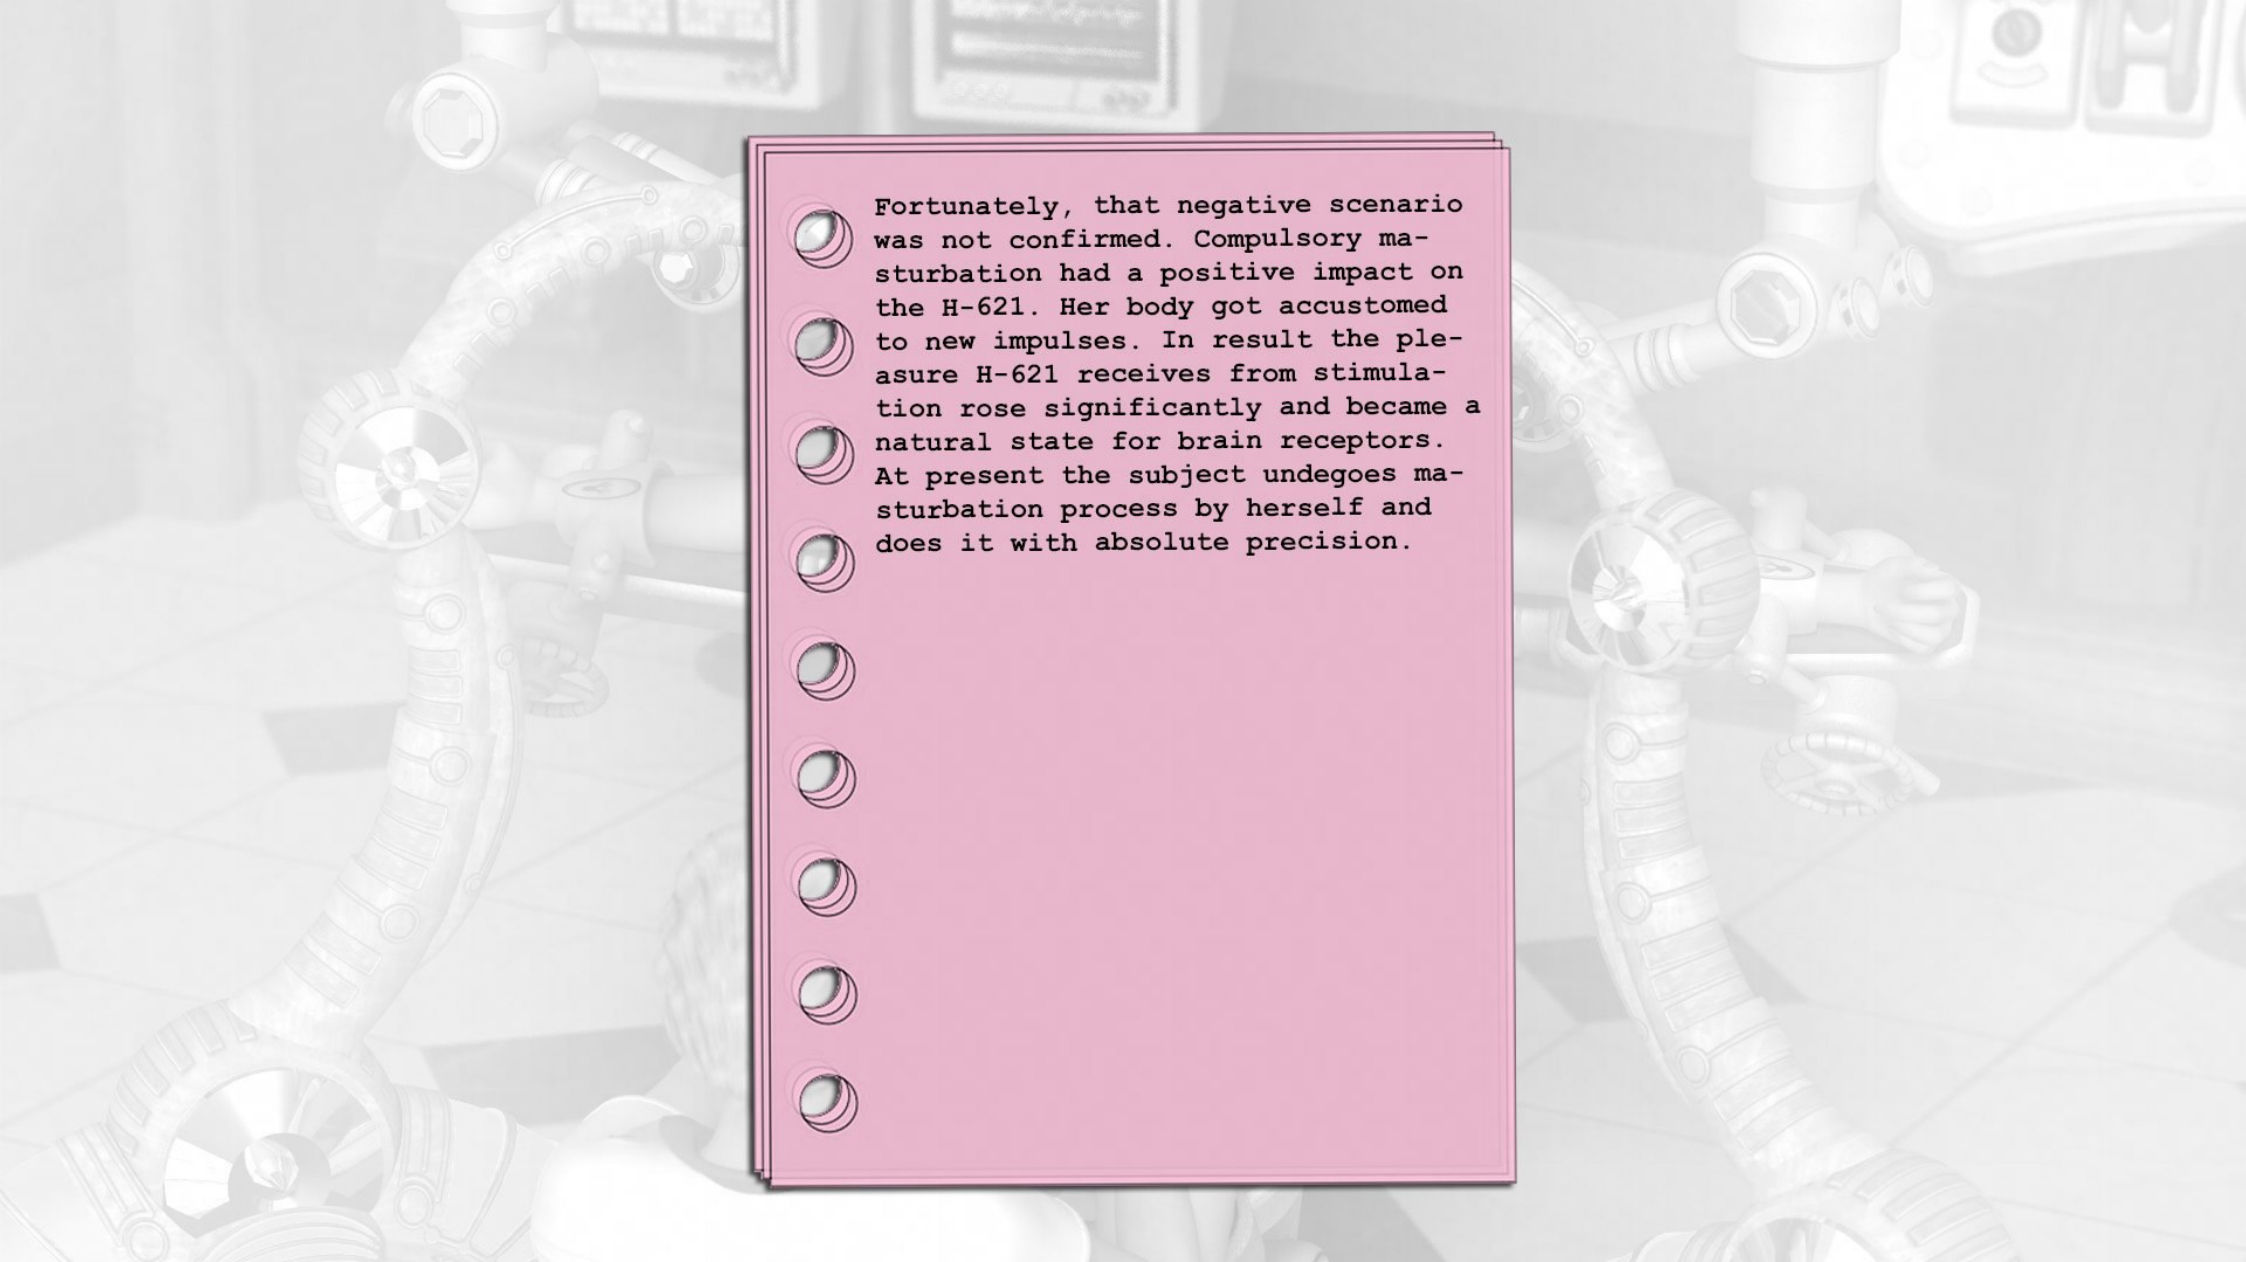

When she finally begins to masturbate, our equipment records very high levels in pleasure zone. There is a possibility that with time the subject will subdue to auto-stimulation enough to discontinue all third party interventions.

The subject's cortex still has problems with processing strong impulses. We are afraid that further actions might result in brain damage.

Fortunately, that negative scenario was not confirmed. Compulsory masturbation had a positive impact on the H-621. Her body got accustomed to new impulses. In result the pleasure H-621 receives from stimulation rose significantly and became a natural state for brain receptors. At present the subject undegoes masturbation process by herself and does it with absolute precision.

There was a decision about retaining H-621 breasts size in its actual state which would allow her to remain mobile for limited distances. She will be able to go from her future owner's apartment to a provided mode of transport without problems.

Breast size and weight reached by the subject are so extreme that she can barely move and needs to put a lot of effort to do so. She spends most of her time in recumbent or seated position. This restriction means H-621 will always be within the owner's reach whenever they wish to use her. On the other hand, if the owner wishes to take her somewhere else H-621 can be easily transported.

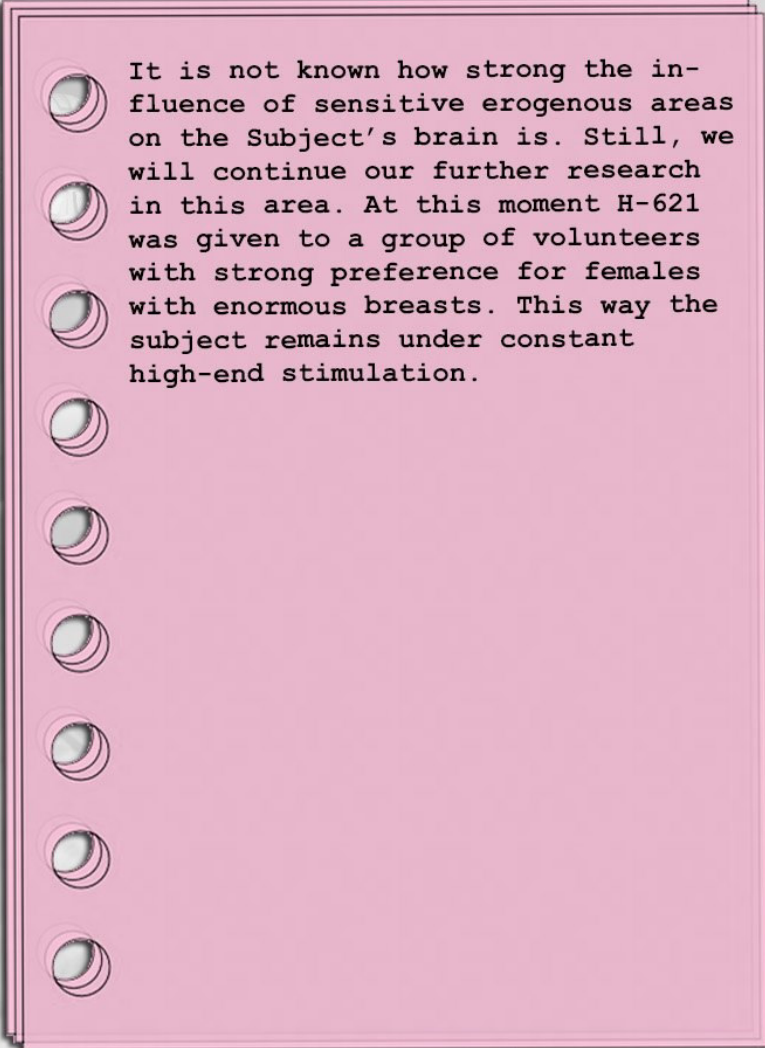

While at destination point she will remain in a designated spot, which makes complicated control systems redundant. H-621 is not capable of relocating her breasts further than a few meters so she won't wander off.

This control system opens up new possibilities. Instead of standard procedure of rising subject's libido to the level where it voluntarily agreed to perform any sexual activity, we now do not need to tamper with the subject's decision. Now it is the subject's own body that works as a control system. It makes it easier for any future user to implement H-621 services. Even if performed activity is against the subject's will her petite body in addition to enormous immobilized breasts makes it almost impossible for her to run away.

The pleasure H-621 gets from stimulation is so overwhelming there is a little need for a foreplay to make her willingly execute further orders. New erogenous areas send intense impulses right to her brain. As a result of a long-term masturbation training the brain reads those impulses both as pleasure and sexual arousal. That is why once aroused subject will fully cooperate and enjoy any sexual activity.

It is not known how strong the influence of sensitive erogenous areas on the Subject's brain is. Still, we will continue our further research in this area. At this moment H-621 was given to a group of volunteers with strong preference for females with enormous breasts. This way the subject remains under constant high-end stimulation.

-
-
-

Extremely long and intense intercourse caused sensory overload of H-621. We assume that further usage of the subject would eventually lead her brain to create new neural connections which will enable full comprehension of provided stimuli.

Routinely speaking - the subject got used to extraordinary pleasure and learned how to enjoy it completely. This turn of events will probably lead to strong addiction. Maybe after a year H-621 will return to continue our further cooperation on this unusual subject matter.

Pink Bunny Inc report issued by Professor Yoshio Tanaka.

PS.

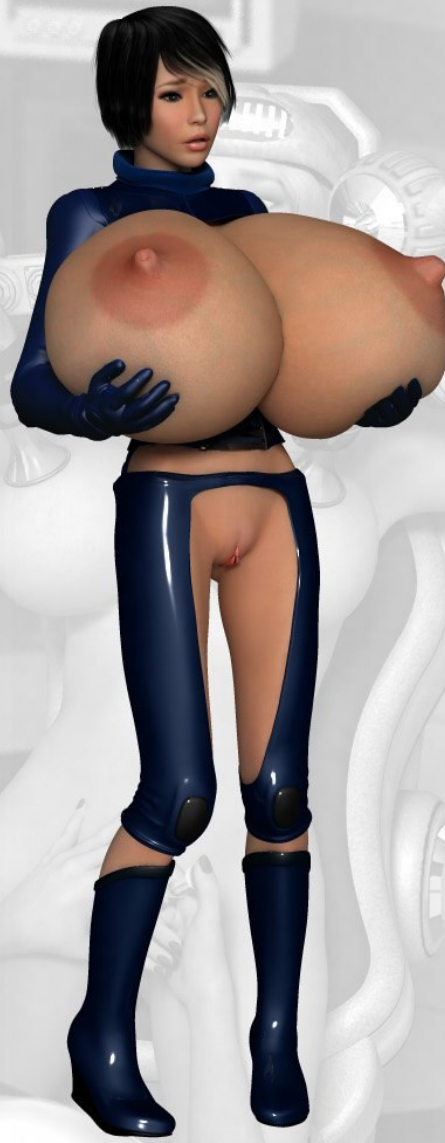

I'd like to remind you that you were to send me more nano-tissue and a new assistant in SW-43-91 project case. My experiments are on hiatus thanks to all this bureaucracy bullshit!

Prof. Tanaka.

Before & After

Before & After

Emilia Marshall

Height: 169 cm (5'6")

Sex: Female

Age: 28

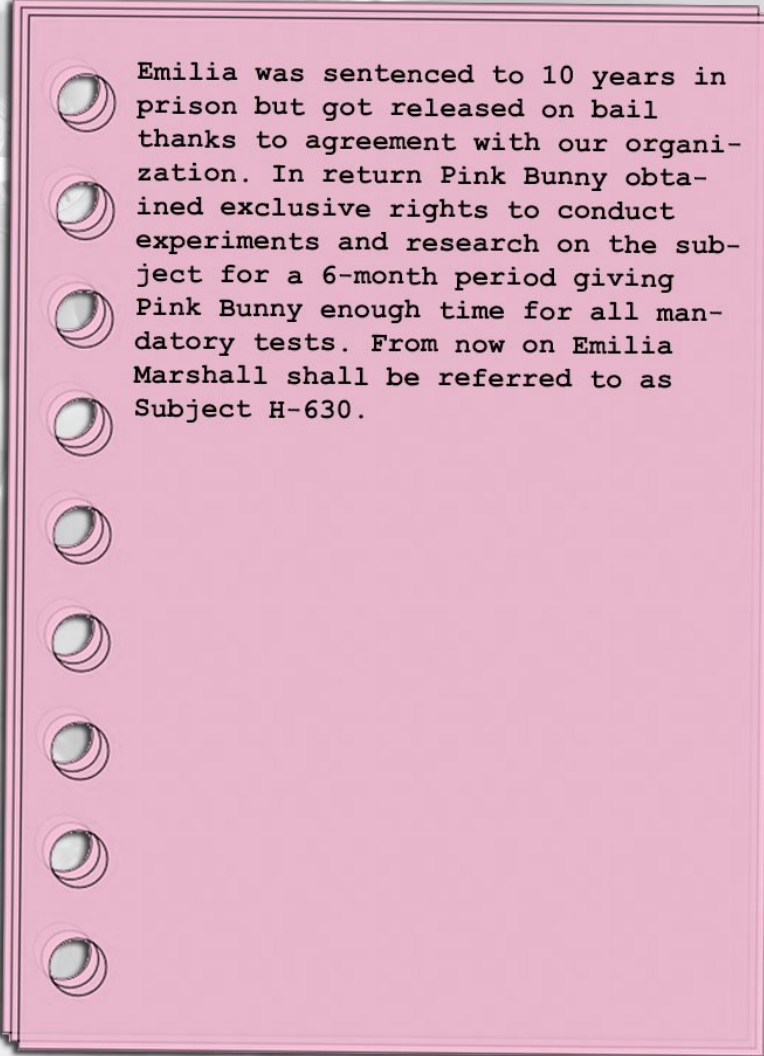

Race: Caucasian

Description:

Dominating and hedonistic nature

Case entry:

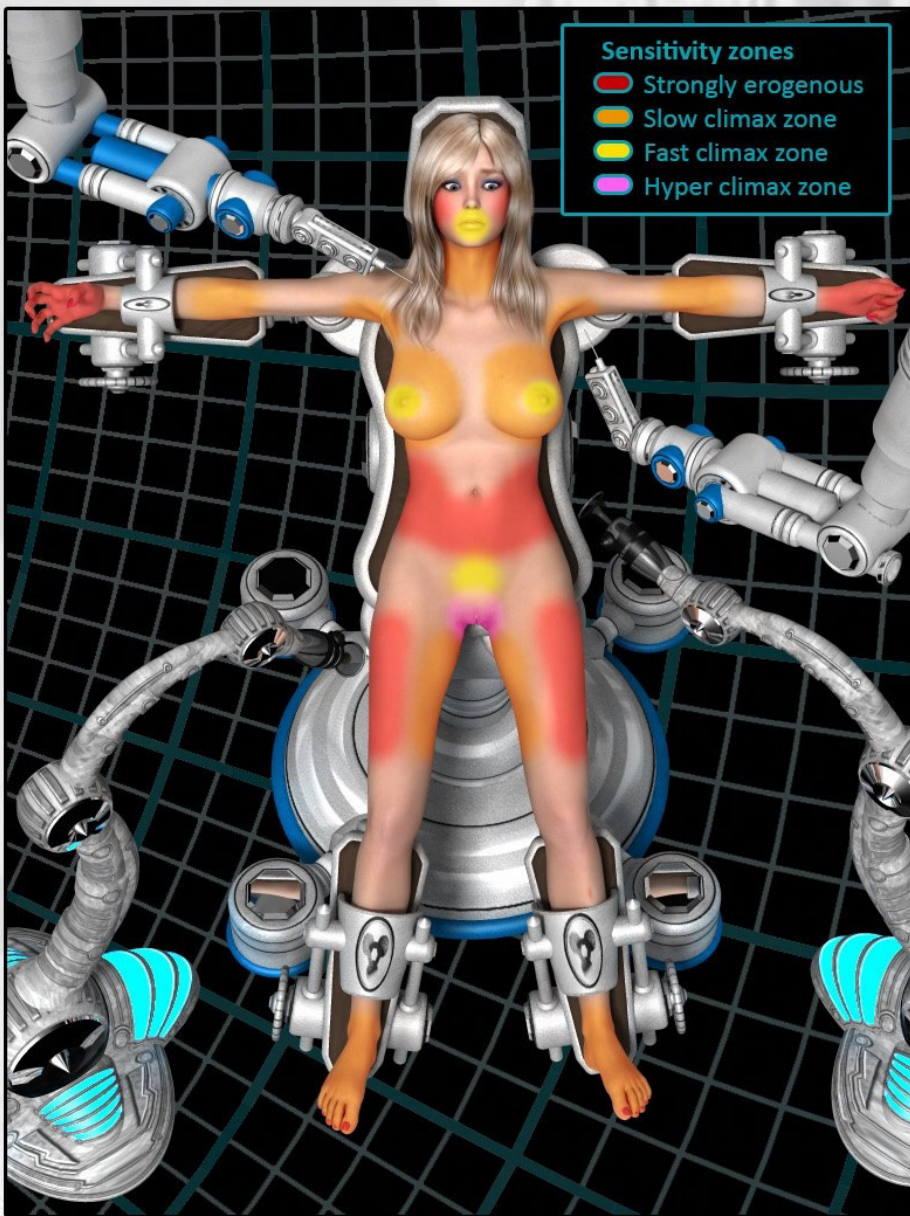

Emilia Marshall was one of three chairpersons in Law Office Administration. She got accused of mobbing and numerous authority abuses. Investigation shed some light on this case, revealing that subject treated her coworkers with mental cruelty and often bullied them forcing into oral sex. Her exceptionally dominating, egoistic and unmoral attitude lead one of her subordinates to suicide. After the discovery of this scandal her associates deprived the subject of her shares pursuant to Treaty of Fund Re-moralization.

Emilia was sentenced to 10 years in prison but got released on bail thanks to agreement with our organization. In return Pink Bunny obtained exclusive rights to conduct experiments and research on the subject for a 6-month period giving Pink Bunny enough time for all mandatory tests. From now on Emilia Marshall shall be referred to as Subject H-630.

Pink Bunny mission statement is to perform experiments on subjects that refer to the crime they committed. H-630 exhibited outstandingly hedonistic attitude. The subject's own satisfaction was worth more than other values. An agreement was put in place concerning subsequent implementation of modifications that will allow the subject to receive pleasure with her whole body.

To achieve that we will tamper with every erogenous area on the subject's body. Following our recent discoveries and research of one of the subjects we will use mutagenic serum based on DNA reprogramming enzymes. It will trigger only selected body parts and prevent any rejections.

Serum is progressively adjusted in small doses to breasts, thigh area, lower abdomen, buttocks, hands, forearms, neck, earlobes and feet. Starting with the first injection the subject's sensitivity in these areas will gradually rise. According to project objectives stimulation of any modified spot should cause strong sexual arousal, although H-630 should receive it differently than stimulation of tier-1 erogenous zones.

*Tanaka's note:
Make sure they understand that tier-1 refers to vagina and clitoris.*

○ We pay close attention to lips, clitoris, labia majora as well as labia minora.

○ Unnatural need of pleasure which drove H-630 to committing crime will be represented in her appearance.

○ Designers decided that in final version she will resemble a fuck toy. H-630 shapes will emphasize her sex-crazed nature in extreme manner.

○ The project includes face reconstruction to resemble the one of a sex doll, that is why the subject's lips will be enlarged to size that exceeds any standard size.

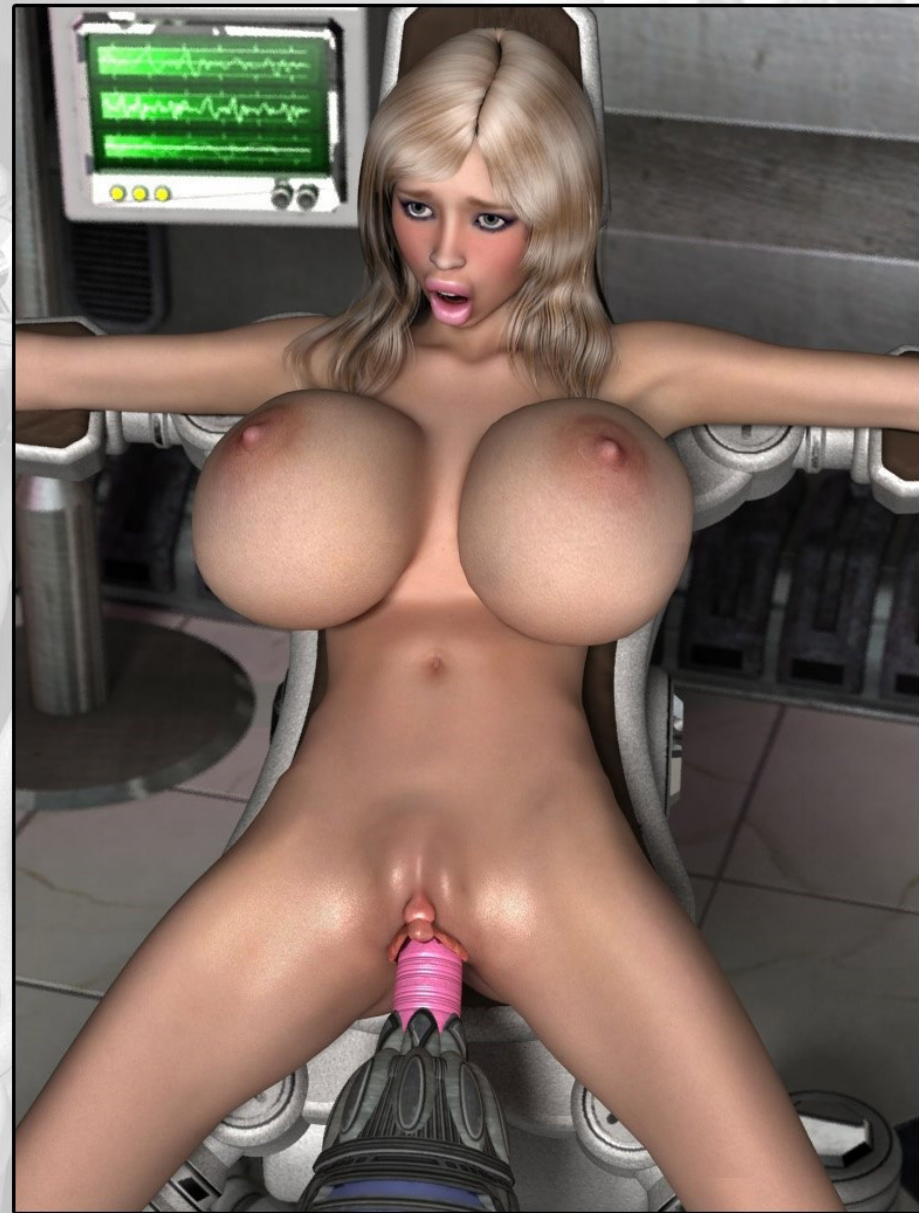

Successive adjustment of Mutagen gave satisfying results - enlargement and sensitization of genitalia and anus, in addition to new neural connections with Reward System. Object's lips also got enlarged, gradually becoming more and more sensitive. We hope that the process will lead to them becoming a tier-1 erogenous zone.

Another step in modification process is vaginal and anal stimulation. This stage needs to be done with exceptional care since H-630 brain is still not used to new impulses. Too aggressive penetration might lead to shock.

-
-
-
-

First tests validated our assumptions. The subject's vagina delivers intense sensations. Minimal insertion of penetrating tip was enough to get a powerful response from H-630. Further stimulation shall be conducted with great care and under no circumstances should vibration or electro-stimulation be turned on. That may lead to the subject's damage.

H-630 will need to undergo a lot of training sessions before learning how to adapt to pleasure of this level.

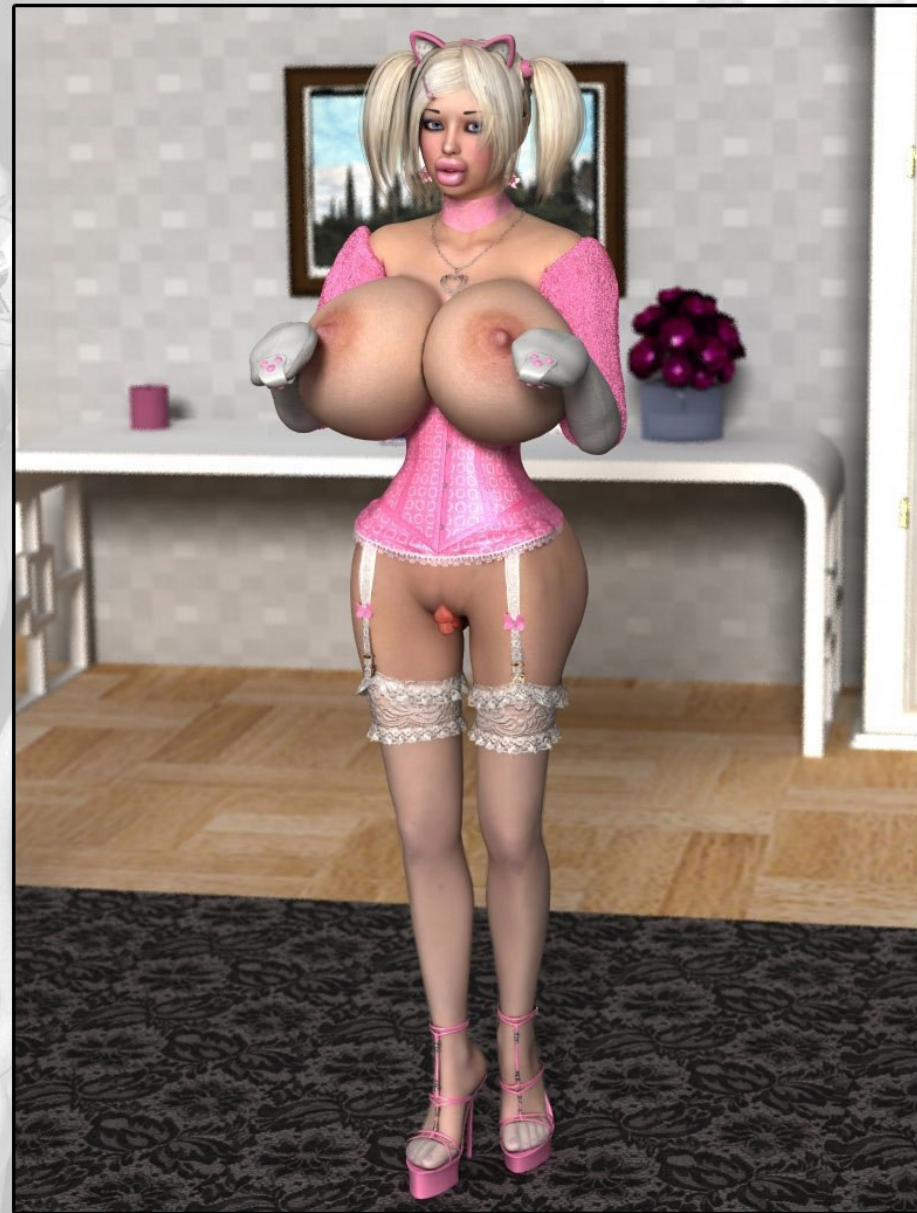

Further training and development trigger strong reactions. Fortunately the subject exhibits good stamina. At present we record 32 strong climaxes a day. We would like to increase the number and reach 40 a day at the same time maintaining this threshold. Currently H-630 is deeply absorbed in the training and for this reason we are 100% sure that she cannot acknowledge constant changes of her body. When we finish the sessions she might be slightly shocked by the actual state of the body.

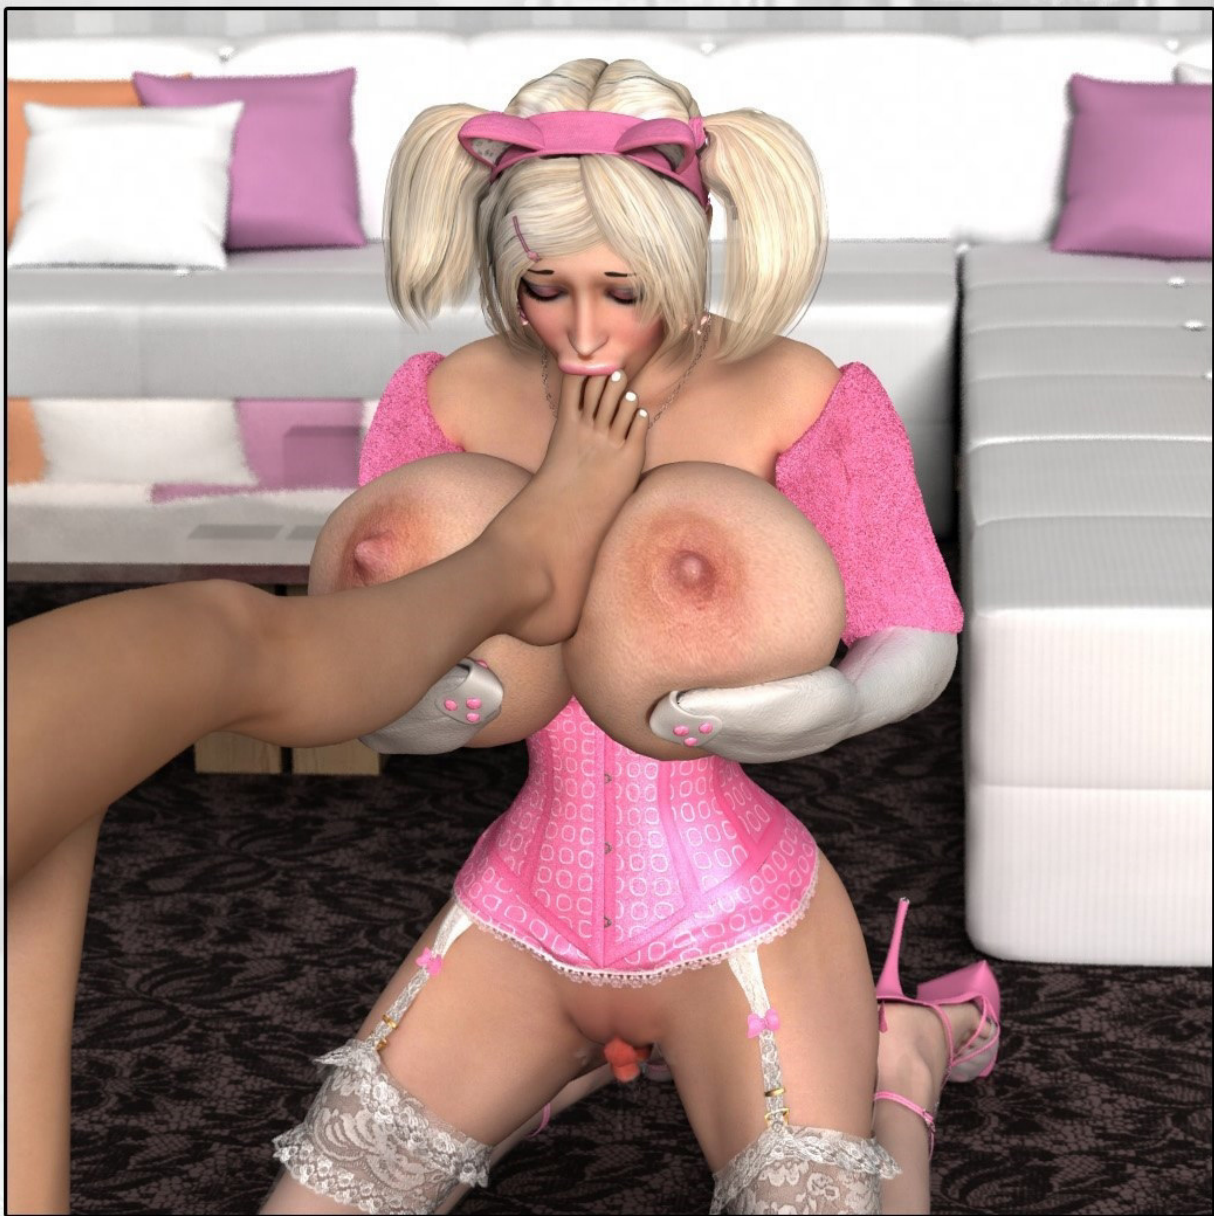

Tanaka's Note: I'm afraid that it might heavily reduce the subject's cognitive abilities. What do we do about it?

The subject has reached planned measurements. Genitals and anus both achieved expected size and sensitivity. Same with lips enlarged to the stage in which they met designer requirements. They are officially a tier-1 erogenous zone. H-630 brain learned how to respond to potent sexual stimulus. To our surprise, long-term training sessions and powerful climaxes caused Reward System displacement, consequently changing the way the subject perceives her surroundings (!) It seems the state in which H-630 is deprived touch is interpreted by the subject as something very unpleasant. Regrettably, training sessions had a negative impact on the subject's IQ, lowering it and reducing concentration. Once supreme H-630 capabilities now rank slightly under average. The most important factor is physical stimulation addiction.

Final surgery is about remodeling last details - waist, face, eyes, hair, and nails. Now she truly looks like a toy used to give pleasure.

H-630 history shows that she cannot be allowed to decide the manner in which she will be satisfied. In the past it led to tragic death of her subordinate, and by extension a tragedy for family and friends. Therefore, we are going to install another prototype, IBC (Intelligent Blocking Chip). The device recognizes brain impulse patterns for decision making. Every IBC registered signal that the subject masturbates automatically shuts down the sense of touch and blocks the impulses responsible for climaxing leading to the subject's body becoming numb. Introduction of this innovative technology means H-630 is no longer physically able to reach climax by her own.

-
-

Results of the experiment are magnificent. H-630 became a perfect pet and a toy to give sexual pleasure. At the same time she is strongly addicted to these kinds of stimuli.

The subject's brain needs constant stimulation - otherwise her mood will drop drastically. Early field research outside the lab demonstrated that she is ready to accomplish literally every owner's demand as long as she is rewarded with caressing.

Stroking her head, hands, areas behind the ears or any other tier-2 erogenous zone gives the subject immense pleasure, almost comparable with that of orgasm.

H-630 desires such contact in the highest degree. Tier-1 zones caresses with kisses, vaginal and anal stimulation or penetration, result in orgasms so powerful that only her specially trained brain is able to withstand them. Right now they are her biggest fantasy. Altogether, these stimuli provoke strong addiction towards the owner and provide full submission.

We hope that her future owner will be a kind and gentle person. H-630 became an extremely fragile toy that has to be handled with care.

Pink Bunny Inc report issued by Professor Yoshio Tanaka.

Before & After

THE END

Thank you for reading!
